

WEB TECHNOLOGY MICRO NOTES WITH ANSWERS

UNIT 3

Servlet: Java program that runs on server and handles client requests.

Servlet Life Cycle:

1. init() - called once when servlet starts.
2. service() - called for every request.
3. destroy() - called once before servlet is removed.

AJAX: Asynchronous JavaScript and XML. Updates part of webpage without reloading.

XML: Extensible Markup Language used to store and transfer data.

doGet vs doPost:

doGet retrieves data and sends data in URL.

doPost sends data in request body and is more secure.

UNIT 4

JSP Life Cycle:

Translation -> Compilation -> `jspInit()` -> `_jspService()` -> `jspDestroy()`.

MVC:

Model = Data and business logic.

View = JSP page.

Controller = Servlet.

SOAP: XML based protocol used for web services.

WSDL: XML document that describes web service operations.

Struts:

Java MVC framework used for web application development.

UNIT 5

PHP Arrays:

1. Indexed Array
2. Associative Array
3. Multidimensional Array

Node.js:

JavaScript runtime used for server-side applications.

ASP.NET:

Microsoft framework for web applications.

WAP Architecture:

WAE -> WSP -> WTP -> WTLS -> WDP -> Network

\$this keyword:

Refers to current object inside a PHP class.

UNIT 6

EJB:

Enterprise JavaBeans used for enterprise applications.

Types of EJB:

1. Stateless Bean
2. Stateful Bean
3. Singleton Bean
4. Message Driven Bean

Rails Advantages:

Rapid development, MVC, DRY, Security.

Ruby Scalar Types:

Integer, Float, String, Boolean, Symbol.

MOST REPEATED QUESTIONS

1. Servlet Life Cycle
2. Servlet Architecture
3. AJAX
4. JSP Life Cycle
5. MVC Architecture
6. SOAP and WSDL
7. PHP Arrays
8. WAP Architecture
9. EJB Types
10. Rails Advantages
